QUICK READ · FRAUD & IDENTITY

Mike · Client Success Manager, **SIGNiX**

Hi «FIRST_NAME»,

If you skim, start here

> **Who:** Mike, your **SIGNiX** Client Success partner (real person, not a bulk campaign).
>
> **Why SIGNiX fits:** Regulators and risk teams want **layered identity assurance and authentication** before consent and signature. That is the work **SIGNiX** is built to support in your digital channels.
>
> **Below:** Three credible reads (Experian, U.S. News, FTC), each with a one-line **Mike's use** so you can scan fast.
>
> **Offer:** Reply and I will review **your top three transaction types** and show where authentication usually pays off. No obligation.

As a Client Success Manager, I spend most of my time helping banks and credit unions get ahead of risk before it turns into disruption. Lately, the theme I hear most is how quickly fraud and identity misuse are evolving. What used to look like “talk someone into sharing a detail” is now a much more **engineered operation**, and AI is widening gaps in verification and authentication at onboarding and beyond. We are hearing the same story from regulators: they expect **stronger identity assurance, layered authentication**, and controls that hold up across the digital identity lifecycle, rather than one-and-done checks.

A few pieces caught my attention this month, and I have linked the full articles below if you want more depth.

1. U.S. fraud and identity theft losses topped $12.7 billion in 2024 (Experian / FTC data)

This is a digestible snapshot of reported fraud and identity-theft volume. I find it helps when I am explaining why **layered verification** and stronger

signer assurance keep showing up in risk and compliance conversations.

Mike's use: grounds the case for stronger signer assurance when you brief leadership or ops.

2. With AI's Help, Fraudsters Are Targeting Smaller Banks (U.S. News)

It makes a practical case that AI is compressing the time and cost of attacks, including pressure on smaller institutions. That pattern is usually what pushes teams beyond **SMS- or email-only** step-ups and toward more adaptive authentication when the signals change.

Mike's use: explains why **adaptive authentication** shows up when we talk about **SIGNiX** with admins and IT.

3. How to recognize and avoid phishing scams (FTC)

This is a practical resource for **staff education**. It is short, credible, and easy to forward when you are reinforcing basics on suspicious messages and escalation paths.

Mike's use: neutral training link you can pair with internal talks on stopping fraud before it hits **SIGNiX** workflows.

FOR IT OR COMPLIANCE

One link to share internally on how **SIGNiX** documents capabilities, including authentication paths for your workflows: SIGNiX Flex API capabilities.

When fraud pressure ramps up, the painful miss is usually **weak identity assurance at the moment of consent**, not the headline alone. Layered authentication is how we raise assurance before signature without turning every transaction into a special project, and it is central to how I help teams get value from **SIGNiX**.

If you want a second set of eyes on your environment, **I am happy to review your top three transaction types** and suggest where an authentication step typically pays off. There is no obligation. It is simply a practical pass tailored to what you are sending today.

Thanks for the partnership,

Mike

Client Success Manager, SIGNiX

«MIKE_PHONE» · «MIKE_EMAIL»

You received this because you work with SIGNiX as part of your organization's integration. Links are for general awareness, not legal advice. Insights here draw on industry reporting (including Experian, U.S. News, and the FTC, consistent with the sources we track in our monthly fraud snapshot). If this is not useful, reply and tell me what would be, and I will adjust what I send.
