QUICK READ · FRAUD & IDENTITY

Mike · Client Success Manager, **SIGNiX**

Hi «FIRST_NAME»,

If you skim, start here:

> **Why you are hearing from me:** I track fraud cases and court outcomes so you have a short, credible read when you need to make the case internally for stronger identity verification.
>
> **What is below:** A November 2025 conviction — a woman used forged documents and aliases to take $75,000 from a bank. The bank approved the loan. The fraud worked because no one could verify who actually signed off on the documents.
>
> **Want help?** Reply with your top three transaction types. I will show you where identity verification closes the gap. No obligation.

Last November, a jury convicted a woman for using false documents and aliases to take $75,000 from Dime Bank in New York. She visited multiple branches under different names. The bank approved the loan. No one could verify who was actually signing the documents.

A conviction is a good outcome. But the bank still lost time and staff resources. And no one could say with certainty who authorized those documents. Here is the case.

> Uniondale Woman Found Guilty in $75K Loan Scam (Long Island Business News, November 2025)

The defendant visited multiple Dime Bank branches using different names and other individuals posing as business owners. She submitted forged corporate documents and a forged bank statement. One $75,000 loan was approved. The fraud worked across multiple branch visits before investigators identified the pattern.

The bank's branch manager visited the listed business address and found nothing. But by the time investigators confirmed the fraud, the money was gone. **The bank had no verified identity attached to the documents at the point of signing.** Anyone could submit paperwork. No one could prove who authorized it.

Mike's use: I use this case when I talk to compliance and lending teams about where **identity verification gaps** live in loan origination workflows. A conviction is not a recovery. The time and cost are already spent.

FOR COMPLIANCE OR LENDING OPERATIONS

If you want to share how **SIGNiX** attaches verified identity to every signing event and creates a defensible audit trail for loan documents, this is a good internal starting point: SIGNiX Flex API capabilities.

The Dime Bank case is not unusual. Loan fraud built on weak document verification happens at institutions of every size. When a member disputes a loan, your team needs to answer one question. **Can you prove who signed it, when, and with what identity verification in place?** A signature alone does not answer that.

Public Key Infrastructure (PKI) attaches a verified identity to every signing event at the moment of consent. It does not slow down the member experience. It gives you proof when you need it.

Reply with your top three transaction types. I will review them and show you where an authentication step closes the gap. No obligation. It takes about 20 minutes.

Thanks for the partnership,

Mike
